

Headings and Paragraphs

Organizing readable, structured content with HTML.

Headings in HTML

Headings help you organize content into sections. HTML provides **6 levels** of headings:

Level	Tag	Purpose
1	<code><h1></code>	Main heading — biggest
2	<code><h2></code>	Subheading
3	<code><h3></code>	Smaller subheading
4	<code><h4></code>	Even smaller heading
5	<code><h5></code>	Even smaller heading
6	<code><h6></code>	Even smaller heading

Example of Headings

```
<h1>This is a Heading 1</h1>
<h2>This is a Heading 2</h2>
<h3>This is a Heading 3</h3>
<h4>This is a Heading 4</h4>
<h5>This is a Heading 5</h5>
<h6>This is a Heading 6</h6>
```

■ Tip

Use only one `<h1>` per page (usually for the page title).

Use headings to structure your content, not to make text look big — that's CSS's job.

Paragraphs in HTML

Paragraphs are written using the `<p>` tag.

Example:

```
<p>This is a paragraph. It can contain multiple sentences of text.</p>
```

Notes

- Browsers automatically add space before and after each paragraph.
- You don't need to press Enter manually for new lines. Use a new `<p>` tag instead.

Line Breaks

If you want to break a line without starting a new paragraph, use the `<br>` tag.

Example:

```
<p>This is line one.<br>This is line two.</p>
```

Note: `<br>` is a self-closing tag, which means it doesn't need a closing `</br>`.

Complete Example

Here is a complete page combining headings, paragraphs, and a line break:

```
<!DOCTYPE html>
<html>
<head>
  <title>Headings and Paragraphs</title>
</head>
<body>
  <h1>My Blog</h1>
  <h2>Introduction</h2>
  <p>Welcome to my first HTML blog post!</p>
  <h2>Why I Love Coding</h2>
  <p>Coding lets you build websites, apps, and games.<br>It's fun and creative!</p>
</body>
</html>
```

Quick takeaway: Use headings to create a clear content hierarchy, `<p>` for paragraphs, and `<br>` when you need a line break inside the same paragraph.
