

Images in HTML

Learn how to add, describe, size, and optimize images on a web page.

Adding Images

Use the `<img>` tag to display images in HTML.

The `<img>` element is a void element, so it does not require a closing `</img>` tag.

Basic Syntax

```

```

Understanding the Attributes

Attribute	Purpose
src	Specifies the path or URL to the image file.
alt	Provides alternative text if the image does not load and supports screen readers.

Example with Local Image

Assume **my-photo.jpg** is in the same folder as your HTML file.

```

```

Example with Online Image

You can also use a complete image URL as the value of **src**.

```

```

Image Size: Width and Height

You can set the displayed size of an image using the **width** and **height** attributes.

```

```

You can also use CSS later for better control over image sizing and responsive layouts.

Best Practices

Tip Always include meaningful **alt** text for accessibility.

Tip Use appropriate image sizes to improve page loading speed.

Tip Avoid stretching images by using incorrect width-to-height ratios.

Quick Reference

Concept	Example / Rule
Image element	<code></code>
Image source	<code>src="image.jpg"</code>
Alternative text	<code>alt="Description"</code>
Width	<code>width="200"</code>
Height	<code>height="150"</code>

Quick Takeaway

The **** element embeds images into a web page. The **src** attribute identifies the image, **alt** provides alternative text, and **width/height** can control its displayed dimensions.
