

Lists in HTML

Organize related information with unordered, ordered, description, and nested lists.

Types of Lists

HTML supports three main types of lists:

List Type	Purpose
Unordered List	Bulleted list
Ordered List	Numbered list
Description List	List of terms and their descriptions

Unordered List

Use the `<ul>` tag for unordered lists. Each item goes inside an `<li>` tag.

```
<ul>
<li>Apples</li>
<li>Bananas</li>
<li>Oranges</li>
</ul>
```

This displays a bulleted list of Apples, Bananas, and Oranges.

Ordered List

Use the `<ol>` tag for ordered lists.

```
<ol>
<li>Wake up</li>
<li>Brush teeth</li>
<li>Go to work</li>
</ol>
```

Description List

Use the `<dl>` tag for description lists. Terms go inside `<dt>`, and descriptions go inside `<dd>`.

```
<dl>
```

```
<dt>HTML</dt>
```

```
<dd>A markup language for creating web pages.</dd>
```

```
<dt>CSS</dt>
```

```
<dd>Used for styling HTML pages.</dd>
```

```
</dl>
```

Nesting Lists

You can put one list inside another to create a hierarchy of related items.

```
<ul>

  <li>Fruits

    <ul>

      <li>Apple</li>

      <li>Mango</li>

    </ul>

  </li>

  <li>Vegetables</li>

</ul>
```

Choosing the Right List

Tip Use unordered lists for things without order, like a shopping list.

Tip Use ordered lists when the sequence matters.

Tip Use description lists for definitions or Q&A-style; content.

Quick Reference

Element	Purpose
	Creates an unordered (bulleted) list.
	Creates an ordered (numbered) list.
	Defines an individual list item.
<dl>	Creates a description list.
<dt>	Defines a term in a description list.
<dd>	Defines the description of a term.

Quick Takeaway

HTML lists help structure related information. Choose **** for unordered items, **** when sequence matters, **<dl>** for terms and descriptions, and nest lists when you need a hierarchy.
