

Introduction to HTML

A clean, beginner-friendly guide to the language behind every webpage.

HTML	HyperText Markup Language
Purpose	Create and structure webpages
Rendered by	Web browsers such as Chrome, Firefox, and Safari

What is HTML?

HTML stands for **HyperText Markup Language**. It is the standard language used to create and structure webpages. Web browsers read HTML code and display it as websites.

Why Learn HTML?

- It is the foundation of all websites.
- You need HTML to build pages before adding CSS for styling or JavaScript for functionality.
- Knowing HTML helps you understand how websites work behind the scenes.

Basic Terminology

Element	A piece of content in a webpage, such as a paragraph, heading, or image.
Tag	Special keywords inside angle brackets, such as <code><p></code> or <code><h1></code> , that define elements.
Attribute	Extra information added to tags, such as href in links or src in images.

Basic Example

A minimal HTML5 document can be written like this:

```
<!DOCTYPE html>
<html>
<head>
  <title>My First Page</title>
</head>
<body>
  <h1>Hello, world!</h1>
  <p>This is my first HTML page.</p>
</body>
</html>
```

How the Document Works

<!DOCTYPE html>	Tells the browser this is an HTML5 document.
<html>	The root element of the HTML page.
<head>	Contains information about the page that is not shown directly on the screen.
<title>	Sets the title shown on the browser tab.
<body>	Contains everything visible on the webpage.

Key Points

- HTML is made up of tags.
- Tags usually come in pairs: an opening tag such as `<p>` and a closing tag such as `</p>`.
- The content goes between the tags.
- Indentation helps make code easier to read, but it is not required.

Quick takeaway: HTML provides the structure of a webpage. CSS controls its appearance, while JavaScript adds behavior and interactivity.
