

IFrames and Embedding Content

Embed webpages and external content inside your HTML page using the `<iframe>` element.

■ ■ What is an IFrame?

An `<iframe>` (inline frame) is used to embed another webpage or external content inside your HTML page.

Basic Syntax

```
<iframe src="https://example.com" width="600" height="400"></iframe>
```

src specifies the URL of the page to embed. **width** and **height** set the size of the frame.

Example: Embed a Website

```
<iframe src="https://www.wikipedia.org"
width="800" height="500"></iframe>
```

Example: Embed a YouTube Video

YouTube provides embed code for each video.

```
<iframe width="560" height="315"
src="https://www.youtube.com/embed/dQw4w9WgXWcQ"
frameborder="0"
allowfullscreen>
</iframe>
```

■ IFrame Attributes

Attribute	Description
<code>src</code>	URL of the page or content to embed.
<code>width, height</code>	Set the size of the iframe.
<code>frameborder</code>	Controls the frame border; <code>0</code> means no border.
<code>allowfullscreen</code>	Allows compatible video content to enter full-screen mode.
<code>loading="lazy"</code>	Delays loading until the iframe is visible.

■ Security Note

Some websites may block iframe embedding for security reasons using headers such as **X-Frame-Options**. When that happens, the external content may not display inside the iframe.

■ Tip

- Use **<iframe>** to embed maps, videos, forms, and external tools.
- Always set appropriate width and height for better layout control.

Quick Takeaway

The **<iframe>** element lets you place external webpages or content inside your page. The most important attributes covered here are **src**, **width**, **height**, **frameborder**, **allowfullscreen**, and **loading="lazy"**.
