

Internal vs External Links

Understand how HTML links connect pages within your website, jump to sections, or point to external resources.

■ Internal Links

Internal links connect one page of your website to another. They help users navigate within your site.

Example

```
<a href="about.html">About Us</a>
```

This opens the **about.html** page located in the same folder.

■ Linking to a Section on the Same Page

Use **#id** in the **href** attribute to jump directly to a specific section on the same page.

```
<a href="#contact">Go to Contact Section</a>
```

```
<h2 id="contact">Contact Us</h2>
```

■ External Links

External links take the user to a different website.

```
<a href="https://www.google.com">Visit Google</a>
```

■ Open External Links in a New Tab

Use the **target="_blank"** attribute when you want an external link to open in a new browser tab.

```
<a href="https://www.example.com" target="_blank">
  Open Example
</a>
```

■ Adding rel="noopener noreferrer" for Security

When using **target="_blank"**, the source recommends adding **rel="noopener noreferrer"** to help prevent security risks.

```
<a href="https://external.com"
  target="_blank"
  rel="noopener noreferrer">
  Visit External Site
</a>
```

■ Summary

Link Type	Example
Internal Link	href="about.html"
Section Jump	href="#section-id"
External Link	href="https://example.com"
New Tab + Safe	target="_blank" rel="noopener"

■ Tip

- Use internal links to connect your content and improve navigation.
- Use external links to reference useful outside resources.

Quick Takeaway

Internal link → connects pages within your website.

Section jump → uses **#id** to move to a section on the same page.

External link → points to another website.

New tab → use **target="_blank"**; the source recommends **rel="noopener noreferrer"**.
